

SkyVision provides Seychelles with viable communications

In an effort to provide viable communications between the main island of Seychelles (Mahe) and 12 neighbouring, smaller islands, Cable & Wireless Seychelles (CWS) required a reliable and efficient network solution that would include fibre restoration for back-up, and internet service with additional back-up for their key customers.

To meet CWS's immediate needs, SkyVision commissioned its IP Trunking service, based on the latest technology developments of DVB-S2X, enabling a cost-effective yet Telco-grade solution. In addition, it installed and deployed its proprietary Private Network solution for a government project, in close cooperation with Seychelles' Cable & Wireless office, the Islands Development Company (IDC).

Connection from the main island to smaller remote islands was successfully implemented using the Romantis VSAT platform which was recently introduced to the market. This solution modernises the communication between main and remote islands.

"We see an increase in the need for reliable and cost-effective satellite communications, even in countries where submarine cables have been existent for several years now. As last mile connectivity remains a necessity, SkyVision intends to continue expanding its reach and providing its customers with the best suited solution for their business requirements," comments Dror Limor, SkyVision VP Sales.
