Vox Telecom Iaunches Private Cloud Services

Vox Telecom's new Microsoft Private Cloud Services portfolio combines Microsoft applications with the cloud to offer medium-to-large companies a single supplier for their communication, collaboration, CRM, and business intelligence needs - as part of a managed service. The turnkey solution includes the network layer, virtual hosting, security, operating system and database, and applications.

It provides access to the Microsoft application suite, including Microsoft Exchange, Microsoft SharePoint, Microsoft Skype for Business, Microsoft Dynamics CRM, Microsoft Dynamics NAV and GP, and Microsoft Business Intelligence. Customers pay for the services that they need, and are able to leverage the benefits of licensing mobility - which allows companies currently using certain Microsoft applications onsite to deploy them to the cloud without paying additional software licensing fees.
