

# Civil organisations challenge new coal inclusion in IRP

Allowing the two new coal plants contemplated by the draft Integrate Resource Plan (IRP) to go ahead would be disastrous for water resources, air quality, health, land, and the climate.

The [Life After Coal Campaign](#) and [Greenpeace Africa](#) say the inclusion of new coal will cost South Africa close to R20bn more than we need to spend, and will make electricity more expensive for all South Africans. If the Department of Energy were to publish the least-cost plan that civil society organisations have been demanding, it would not include any new coal.

Including an additional 1000 MW of new coal-fired power - on top of existing and under-construction coal - puts the Department of Energy in conflict with the rights enshrined in the Constitution, given that there are safer, cleaner, and less-expensive energy options available.

“While we recognise the increased emphasis on renewable energy in the draft IRP, unless the minister of energy substantially revises and amends the draft IRP to ensure that the constitutional right to a healthy environment is preserved and protected - and specifically excludes any new coal - the department runs the risk of the IRP being challenged in court,” warns Melita Steele, senior climate and energy campaign manager at Greenpeace Africa.

## Coal is outdated

Robyn Hugo, head of the pollution & climate change programme at the Centre for Environmental Rights, says that the updated IRP fails to take sufficient account of the external costs of the various available technologies. “Coal is an outdated and dirty technology – the environmental and health costs of which have not been factored into electricity planning.” At present, almost 90% of South Africa’s energy mix is already comprised of coal, despite many of these plants failing to meet the required emission standards and causing devastating health impacts.

A 2016 [report](#) by UK-based air quality and health expert, Dr Mike Holland, found that air pollution from Eskom coal-fired power stations kills more than 2,200 South Africans every year, and causes thousands of cases of bronchitis and asthma in adults and children annually. “This costs the country more than R33bn annually, through hospital admissions and lost working days”, says Bobby Peek, director of groundWork.

## Health impacts

“In addition to these severe health impacts, coal-fired electricity is also enormously water-intensive and the estimated costs of rehabilitating old mines and mining areas runs into the billions”, says Steele.

“Even discounting the health and environmental dangers of coal, it simply makes no economic sense to include coal in the IRP, as it is more expensive than other technologies such as wind and solar power,” says Makoma Lekalakala, director of Earthlife Africa.

The Campaign and Greenpeace Africa will reiterate all of these – and other concerns – in comments on the draft IRP. It is crucial that South Africa’s future electricity plan is least-cost and in the public interest. All South Africans – including coal workers and the unemployed – must be part of the process to ensure a just energy transition.
